INTERESTS	Computer Networks and Operating Systems	
EDUCATION	Keio University , Tokyo Japan	
	Ph.D. in Graduate School of Media and Governance Program: Cyber Informatics Thesis: The Internet is not an Internet—Principles, Evasion and Implications for Transport Protocols	Apr 2009 – Mar 2012
	M.S. in Graduate School of Media and Governance Program: Cyber Informatics Thesis: Bidimensional-Probe Multipath Congestion Control for Shared Bottleneck Fairness	Apr 2007 – Mar 2009
	B.S. in Faculty of Environment and Information Studies Thesis: Fast Transport Layer Handover Using Single Wireless Interface	Apr 2003 – Mar 2007
WORK EXPERIENCE	Lecturer (Assistant Professor) , School of Informatics, University of Edinburgh Senior researcher , NEC Laboratories Europe, Heidelberg, Germany Software engineer , NetApp, Munich, Germany Research scientist , NEC Laboratories Europe, Heidelberg, Germany	Jan 2020 – present Nov 2016 – Dec 2019 Dec 2014 – Oct 2016 Jul 2012 – Nov 2014
RESEARCH EXPERIENCE	Visiting student researcher , University College London (UCL), London, UK Advisor: Prof. Mark Handley Focus: Middlebox, Multipath Transport Protocol. Research intern , Nokia Research Center, Espoo, Finland Advisor: Dr. Lars Eggert Focus: Multipath Transport Protocol.	Apr 2010 – Sep 2010 Jul 2008 – Jan 2009
AWARDS	Google Research Scholar Award * Facebook Research Award * Best paper award , ACM SOSR'15 * Community award , USENIX NSDI'12 IRTF/ISOC Applied Networking Research Prize (ANRP) * * as the sole investigator or lead author	Apr 2022 Aug 2021 Jun 2015 Apr 2012 Nov 2011
RECENT RESEARCH	Prism: Content-Aware Routing over TCP Prism enables content-aware routing of arbitrary-sized, encrypted application data over TCP, unlike the existing systems that rely on a custom UDP-based protocol. Prism modernizes the TCP handoff in the aid of programmable switches for robust operation and conformance to relevant features in recent Linux kernels. PASTE: A Network Stack for Non-Volatile Main Memory PASTE is a network stack that offers unified abstractions of network and non-volatile main memory. It fills the gap between the storage and network stacks designed in isolation, and solves the problem with the costs of moving and transforming data between these stacks that are significant for non-volatile main memory that offers fast, byte-addressable persistence. A Storage Stack for SoC-Based Accelerators This work is motivated by the slow storage access in the applications that run in the PCIe-attached accelerator devices equipped with general-purpose CPU cores in addition to the specialized ones. It explores direct storage access architecture that bypasses the host CPUs, process or kernel, while providing useful abstractions to the applications. mSwitch: A Highly-Scalable, Modular Software Switch mSwitch solves the scalability problem of existing software switches that is crucial to consolidate a large number of VMs or virtualized network functions by a novel packet forwarding algorithm and streamlined data path. It was initially designed for ClickOS, a tiny unikernel that runs Click, and MultiStack, a framework that runs multiple user-space network stacks. Middlebox Measurement for TCP Extensibility This work was motivated by exploring viable design of Multipath TCP. It transmits various non-existent TCP traffic that mimics possible future TCP extensions to our server and examines on-path actions to the packets. This is the first work that examines in-depth middlebox behaviour prevalent in the Internet.
